

# D-28-6 Air Diffuser

Make-Up Air and Combustion Air Diffuser

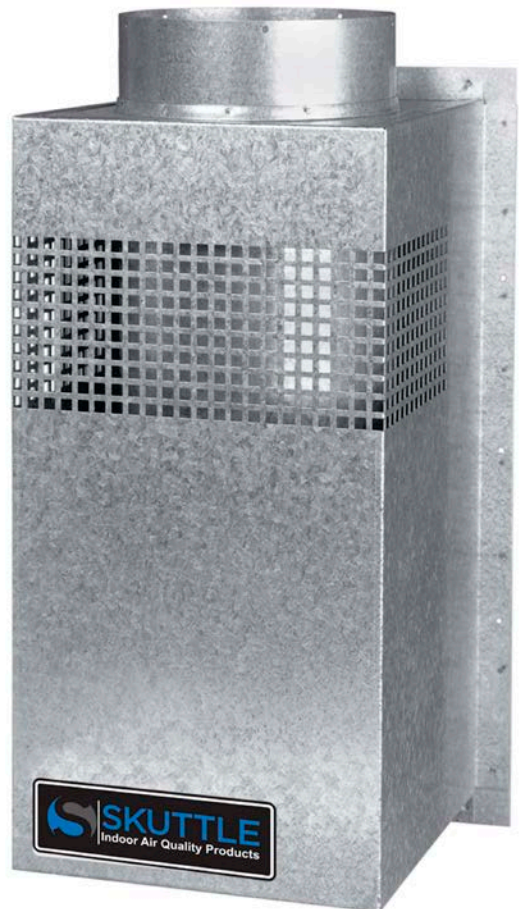

Supplies Combustion Air for Fuel-Burning Appliances

## Model D-28-6 Product Features

The Skuttle Make-Up Air and Combustion Air Diffuser supplies supplementary combustion air for appliances [furnaces, dryers, etc.] with inadequate combustion air sources.

- Works in any home as a fresh air supply
- Reduces drafts caused by poor air flow
- Aids in reducing indoor air pollution by replacing exhausted air
- Traps cold air entering the home
- Provides combustion air when other methods do not supply sufficient air

## Specifications

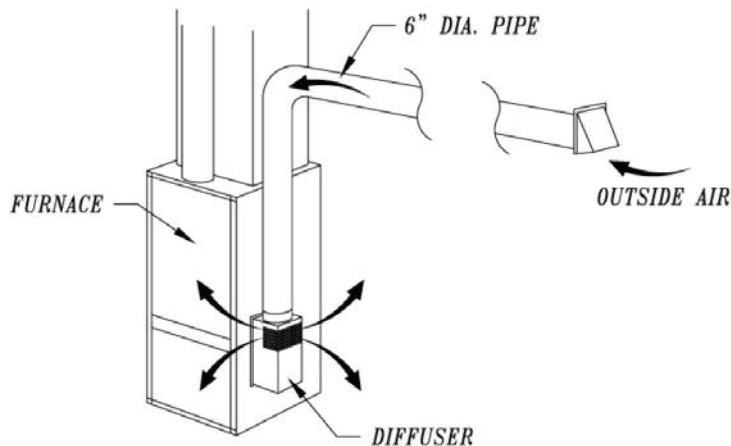

**Fresh Air Inlet.** .....6" diameter  
Includes 6" screened outside hood

## How Air Diffusers Work

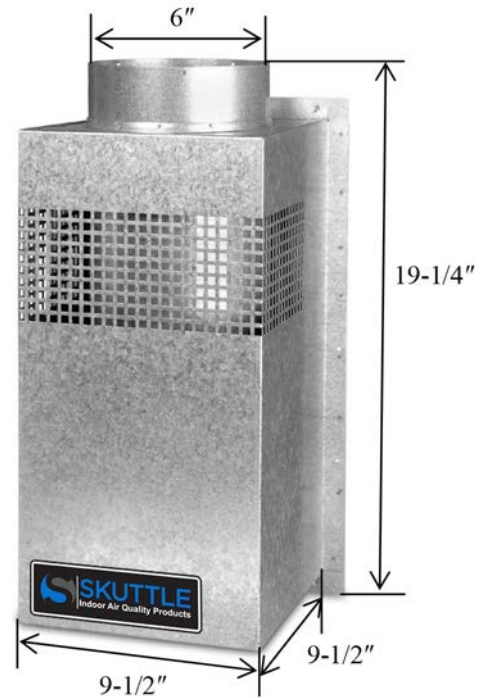

Generally installed 12 inches from the appliance's combustion air intake, the Diffuser connects to a 6-inch insulated duct, which in turn, connects to a screened, fresh air inlet mounted on the home's exterior.

As the colder, heavier outside air enters the Diffuser, the unit acts as a check valve or cold air trap, automatically diffusing auxiliary combustion air into the area around the appliance.
